Generic Collections: Solutions

20

I think this is the most extraordinary collection of talent, of human knowledge, that has ever been gathered together at the White House—with the possible exception of when Thomas Jefferson dined alone.

—John F. Kennedy

Journey over all the universe in a map.

-Miguel de Cervantes

Not by age but by capacity is wisdom acquired.

—Titus Maccius Plautus

Objectives

In this chapter you'll learn:

- What collections are.
- To use class Arrays for array manipulations.
- The type-wrapper classes that enable programs to process primitive data values as objects.
- To use the pre-built generic data structures of the collections framework.
- To use iterators to "walk through" a collection.
- To use persistent hash tables manipulated with objects of class Properties.
- To use synchronization and modifiability wrappers.

Self-Review Exercises

a) A(n) is used to iterate through a collection and can remove elements from the collection during the iteration. ANS: Iterator. b) An element in a List can be accessed by using the element's ANS: index. c) Assuming that myArray contains references to Double objects, occurs when the statement "myArray[0] = 1.25;" executes. ANS: autoboxing. d) Java classes and provide the capabilities of arraylike data structures that can resize themselves dynamically. ANS: ArrayList, Vector. e) If you do not specify a capacity increment, the system will the size of the Vector each time additional capacity is needed. ANS: double. f) You can use a(n) to create a collection that offers only read-only access to others while allowing read/write access to yourself. ANS: unmodifiable wrapper. g) Assuming that myArray contains references to Double objects, occurs when the statement "double number = myArray[0];" executes. ANS: auto-unboxing. h) Algorithm of Collections determines whether two collections have elements in common. ANS: disjoint. 20.2 Determine whether each statement is true or false. If false, explain why. a) Values of primitive types may be stored directly in a collection.		THE VIEW EXCITION

- 20.
 - the primitive type is converted to its corresponding type-wrapper class.
 - b) A Set can contain duplicate values.

ANS: False. A Set cannot contain duplicate values.

c) A Map can contain duplicate keys.

ANS: False. A Map cannot contain duplicate keys.

d) A LinkedList can contain duplicate values.

ANS: True.

e) Collections is an interface.

ANS: False. Collections is a class; Collection is an interface.

f) Iterators can remove elements.

g) With hashing, as the load factor increases, the chance of collisions decreases.

ANS: False. As the load factor increases, fewer slots are available relative to the total number of slots, so the chance of a collision increases.

h) A PriorityQueue permits null elements.

ANS: False. Attempting to insert a null element causes a NullPointerException.

Execises

NOTE: Solutions to the programming exercises are located in the ch20solutions folder. Each exercise has its own folder named ex20_## where ## is a two-digit number representing the exercise number. For example, exercise 20.17's solution is located in the folder ex20_17.

20.3 Define each of the following terms:

a) Collection

ANS: Interface Collection is the root interface in the collection hierarchy from which interfaces Set, Queue and List are derived.

b) Collections

ANS: Class Collections provides static methods that manipulate collections polymorphically. These methods implement algorithms for searching, sorting, and so on.

c) Comparator

ANS: An interface that specifies how collections objects are ordered.

d) List

ANS: An interface implemented by ordered collections that allow duplicate elements (sequences), such as ArrayList, LinkedList and Vector.

e) load factor

ANS: The ratio of the number of occupied cells in a hash table to the size of the hash table.

f) collisior

ANS: A situation where two different keys hash into the same cell.

g) space/time trade-off in hashing

ANS: When the load factor is increased, the result is better memory utilization. However, the program runs slower due to increased hashing collisions.

h) HashMap

ANS: Java utilities package class that enables programmers to use a hash table to store key/value pairs. Unlike Hashtable, it is not synchronized and permits null keys and values.

20.4 Explain briefly the operation of each of the following methods of class Vector:

a) add

ANS: Appends the specified element to the end of this Vector.

b) set

ANS: Replaces the element at the specified position.

c) remove

ANS: Removes the first occurrence of an element from the Vector.

d) removeAllElements

ANS: Removes all Vector elements and sets its size to zero.

 $e) \quad {\tt removeElementAt}$

ANS: Removes the element at the specified position.

f) firstElement

ANS: Returns a reference to the first element in the Vector.

g) lastElement

ANS: Returns a reference to the last element in the Vector.

h) contains

ANS: Determines whether a Vector contains a specified object.

i) index0f

ANS: Returns the position of the first occurrence of a specified object, or -1 if the object does not occur in the Vector.

j) size

ANS: The current number of elements in the Vector.

k) capacity

ANS: The number of elements available for storage (used and unused).

4 Chapter 20 Generic Collections: Solutions

20.5 Explain why inserting additional elements into a Vector object whose current size is less than its capacity is a relatively fast operation and why inserting additional elements into a Vector object whose current size is at capacity is a relatively slow operation.

ANS: A Vector whose current size is less than its capacity has memory available. Insertions are fast because new memory does not need to be allocated. A Vector that is at its capacity must have its memory reallocated and the existing values copied into it.

20.6 By extending class Vector, Java's designers were able to create class Stack quickly. What are the negative aspects of this use of inheritance, particularly for class Stack?

ANS: Operations can be performed on Stack objects that are not normally allowed, which can lead to corruption of the stack. For example, Vector method insertElementAt should not be performed on Stack.

- **20.7** Briefly answer the following questions:
 - a) What is the primary difference between a Set and a Map?

ANS: Maps contain both the key and the value, and Sets contain only values. Sets contain unique values; Maps contain unique keys but may contain duplicated values.

b) What happens when you add a primitive type (e.g., double) value to a collection?

ANS: Autoboxing occurs when a primitive type value is added to a collection. For example, a double primitive type value is converted to an object of its wrapper class Double.

c) Can you print all the elements in a collection without using an Iterator? If yes, how?

ANS: Yes, the elements in a collection can be printed by iterating through the collection with the enhanced for statement. Alternatively, you can use the collection's toString method.

20.8 Explain briefly the operation of each of the following Iterator-related methods:

a) iterator

ANS: Returns an Iterator for a collection.

b) hasNext

ANS: Determines whether a collection has another element.

c) next

ANS: Returns the next element in a collection.

20.9 Explain briefly the operation of each of the following methods of class HashMap:

a) put

ANS: Adds a key/value pair into the HashMap.

b) get

ANS: Locates the value associated with the specified key.

c) isEmpty

ANS: Returns a boolean value indicating whether or not the HashMap is empty.

d) containsKey

ANS: Determines whether specified key is in the HashMap.

e) keySet

ANS: Returns a Set of the keys in the HashMap.

20.10 Determine whether each of the following statements is *true* or *false*. If *false*, explain why.

a) Elements in a Collection must be sorted in ascending order before a binarySearch may be performed.

ANS: True.

b) Method first gets the first element in a TreeSet.

ANS. True

c) A List created with Arrays method asList is resizable.

ANS: False. The List is fixed length.

- **20.11** Explain the operation of each of the following methods of the Properties class:
 - a) load

 $\boldsymbol{ANS:}\,$ Reads the contents from a specified InputStream.

 $b) \ \ \mathsf{store}$

 $\textbf{ANS:} \ \ \textbf{Writes the contents to a specified OutputStream.}$

c) getProperty

ANS: Returns the value associated with a key.

d) list

ANS: Displays the contents of a Properties object to the specified output stream.
